CSS: Shadows

Two Types of Shadows

box-shadow:
simulates a drop shadow - a copy of the object with its position offset horizontally and vertically

text-shadow:
an exact copy of the text with its position offset horizontally and vertically

Shadow Property Values

The following rules apply to both box-shadow and text-shadow. <u>Give 4 values separated by spaces:</u>
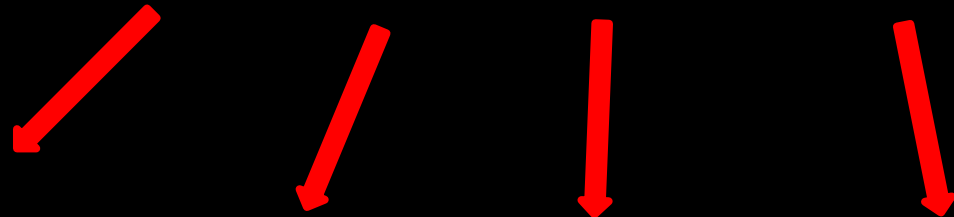

box-shadow: 5px -7px 6px #ff0012;

x-offset

y-offset

blur radius

color

Multiple Shadows

You can give an element more than one shadow. Separate each group of shadow values with a <u>comma</u>

<u>example</u>:
   text-shadow: 1px 1px 1px gray,
              2px 2px 1px gray,
              3px 3px 1px gray;

Activity

1) <u>Google search</u> "CSS Great Examples of Text-shadow"
2) <u>Go to the links</u> that come up and look for things you like
3) <u>Try adding some text-shadow to something in your How To Web Page</u>
4) After you've finished, do the same 3 things, but this time with <u>box-shadow</u>
